

Vet-Stem Regenerative Therapy

With Vet-Stem Regenerative Veterinary Medicine®, a specially trained veterinarian takes a small fat sample from your dog. This procedure is similar to having a small growth removed from under the skin. The cells are then overnighted to the Vet-Stem lab in California where they are processed and the regenerative cells concentrated. The cells are shipped back within 48 hours when the veterinarian can inject them into the injured site.

Vet-Stem Regenerative Veterinary Medicine® can be used to help treat a variety of canine afflictions including, arthritis, injured tendons and ligaments, degenerative diseases, and fractures. Make an appointment with Dr. Staunton for more information regarding Vet-Stem® treatment.
